1.0 INTRODUCTION

Sterling Environmental Engineering, P.C. (STERLING) was retained by the developer of the Blackhead Mountain Lodge (BHML) redevelopment project (hereinafter “the project”) to assist in the hydrogeologic testing of a groundwater source to serve as the public water supply for the project. This hydrogeologic report documents the procedures followed for hydrogeologic testing to determine the safe yield of the local groundwater supply for comparison to the maximum daily demand of the project. The safe yield is the rate of groundwater extraction that can be maintained for a prolonged period of time without producing negative effects. As documented in this report, the safe yield is at least 32 gallons per minute (gpm) and capable of supporting development projects that will extract groundwater at a rate equal to or less than 32 gpm.

The project area (hereinafter “the site”) is located in the Town of Cairo, Hamlet of Round Top, Greene County, New York and consists of the following three parcels spanning 102.31 acres:

Parcel ID 116.00-1-24, 64 & 74 Crows Nest Road, 94.95 acres

Parcel ID 116.00-1-25, 54 Crows Nest Road, 1.23 acres

Parcel ID 116.16-1-1, 153 Bald Hills Road N, 6.13 acres

A Site Location Map on a United States Geological Survey quadrangle map is provided as Figure 1. The project will include an expanded tourist resort with the following uses and associated water demand:

Table 1 – Water Supply Maximum Daily Demand

Building Use	Maximum Capacity	Unit	Flow Rate (gpd)	Total (gpd)
Lodging	272	Bedroom	110	29,920
Restaurant	300	Seats	28	8,400
Amenity	80	Seats	5	400
Bar	45	Seats	16	720
Spa	70	Patrons	8	560
Laundry	3	Machines	464	1,392
Employee Kitchen	100	Seats	28	2,800
Event Barn	200	Seats	10	2,000
Utility/Backwash	1	Per day	20	20
Maximum Daily Demand (gpd)				46,212
Maximum Daily Demand (gpm)				32

Note: Flow rates obtained from NYS Design Standards for Intermediate Sized Wastewater Treatment Systems with 20% reduction for use of water saving plumbing fixtures. Utility/Backwash flow rate provided by the utility designer and accounts for 15 gpd of pool backwash and 5 gpd of WWTP sink use.

The design water demand was determined using Method 1 of the New York State Design Standards for Intermediate Sized Wastewater Treatment Systems, which uses established typical per-unit hydraulic loading rates at the maximum expected operational conditions. As provided in Table 1, the project will have a maximum daily demand of 32 gpm at full buildout and full occupancy. The developer reports a projected average stabilized annual occupancy of 52% for the resort use. Therefore, the actual long-term water demand is expected to be substantially lower than the 32 gpm pumping rate assessed in this report.

In accordance with the New York Codes, Rules, and Regulations Subpart 5-1 Public Water Supplies (Subpart 5) and the 2022 Recommended Standards for Water Works, the total developed groundwater source capacity shall equal or exceed the design maximum daily demand with the largest producing well

out of service. Therefore, a minimum of two water supply wells are necessary to provide redundancy of the water supply.

As documented in this report, two onsite groundwater wells (identified as Well 5 and Well 4 on Figure 2) have been installed that produce a minimum of 32 gpm. Individual constant rate pumping test were performed on Well 5 and Well 4, and the results of the pumping tests demonstrate the maximum daily demand can be sustained individually by each well without causing adverse impacts on the local aquifer and adjacent offsite private water supply wells.

1.1 Geology and Hydrogeology

The site is located along the eastern slope of Arizona Mountain in the eastern Blackhead Mountain range and directly south of Shingle Kill. The site is underlain by a thin layer of glacial till deposited directly overlying the relatively flat-lying Middle Devonian aged shales and sandstones of the Moscow Formation. Till deposits cover the majority of the site with the exception of bedrock exposures in areas of higher relief. Bedrock exposures upgradient of, and at higher elevations than the site likely act as areas of groundwater recharge. A review of local LiDAR-derived digital elevation models (DEM) indicated the dominant joint orientation of the bedrock is northwest-southeast, which is consistent with field observations.

In 2009, the New York Rural Water Association prepared a Groundwater Resources Study and Protection Plan for the Town of Cairo. The report indicated that bedrock wells yielding 9 to 30 gallons per minute (gpm) are present in proximity to the site. The site includes several small man-made ponds indicating the presence of shallow and/or perched groundwater above low permeable glacial till deposits exposed at the surface. Preliminary hydrogeologic testing indicated both shallow and deep water-bearing zones in the bedrock beneath the site. The depth to water in the shallow zone ranges from approximately 10 to 60 feet below ground surface (bgs), and the depth to water in the deeper zone ranges from approximately 170 to 260 bgs. These measurements reflect a vertical downward gradient throughout the fractured, saturated bedrock aquifer. A review of the Well 4 water well completion report indicated that large fractures were identified at 560 and 565 feet bgs during the drilling of the well. These deep fractures are likely characteristic of the higher yielding zone identified during the hydrogeologic testing of Well 4 and Well 5. The groundwater flow direction is to the east following the general site topography.

1.2 Water Well Inventory

There are currently nine (9) groundwater wells on the site as summarized in Table 2 and shown on Figure 2. Four (4) wells (Wells A, B, C, and 1) were completed prior to the proposed project and were used either as a potable water supply or for irrigation purposes. An additional five (5) wells (Wells 2, 3, 4, 4A, and 5) were completed as test wells for potential use as new water supply wells to support the project.

Table 2 – Groundwater Well Construction Details

Well ID	Date Installed	Ground Elevation¹ (ft)	Total Depth (ft)	Depth of Casing (ft)	Preliminary Well Yield² (gpm)
Well-A	Unknown	880	70	<50	7
Well-B	Unknown	883	200	<50	1/2
Well-C	Unknown	919	90	10	7
Well-1	Unknown	900	510	20	4
Well-2	April 17, 2024 to April 18, 2024	930	498	50	7.5
Well-3	June 10, 2024	1,010	610	60	1
Well-4A	June 6, 2024	1,080	605	60	1/4
Well-4	June 11, 2024 - June 12, 2024	950	610	60	20 +
Well-5	June 13, 2024 - June 14, 2024	904	445	60	25 +

Notes: 1 – Ground elevations estimated per USGS topographic resource mapping or the site survey map.

2 – Preliminary well yield determined between March and August 2024 by NYSDEC registered water well contractor Claverack Well and Pump Service (NYRD10351) and Titan Drilling Corporation (NYRD10178)

Based on the water well construction details and preliminary yield, Wells A, B, C, 3, and 4A were eliminated from consideration as water supply wells for the project. To further assess the remaining wells, STERLING oversaw a step drawdown testing program on Wells 1, 2, 4, and 5 (see Section 2.2). The well locations are shown on Figure 2. The results of the step drawdown test indicated that Well 4 and Well 5 can achieve the maximum daily demand and warranted further evaluation to serve as public water supply wells for the project. Well 1 and 2 are low yielding and were eliminated from further consideration. Well completion logs for Well 2, Well 4, and Well 5 are provided in Appendix A. No completion log was available for Well 1. All wells will be retained for potential monitoring through final permitting with NYSDOH. Following approval of the water supply by NYSDOH, all onsite wells except for Well 4 and Well 5 will be abandoned in accordance with applicable regulations prior to putting the water supply into service.

1.3 Hydrogeologic Study Executive Summary

As documented below in Section 2, a comprehensive hydrogeologic study was completed that consisted of two independent 72-hour constant rate pumping tests on Well 4 and Well 5 with concurrent monitoring at a combination of onsite and offsite wells as shown on Figure 3. The study documented the presence of a shallow fracture zone with low permeability and a deeper fracture zone with higher permeability (see Figures 4 and 5). Well 4 and Well 5 are completed into the deeper fracture zone and provided achieved stabilized drawdown at 32 gpm during the constant rate test. As shown on Figure 4, two adjacent private water supply wells are also completed into the deeper fracture zone and displayed direct influence from the onsite pumping tests. A detailed drawdown and recovery assessment was performed as shown on Figures 6 and 7 that demonstrates the water bearing deeper fracture zone is achieving at least 90% recovery within 24 hours of the pumping tests and that the aquifer is not being depleted. 180-day long-term drawdown projects were performed (see Appendix C) that demonstrate continued water availability to the project and residential wells under a conservative scenario of continuous pumping at the maximum demand.

2.0 HYDROGEOLOGIC INVESTIGATION

2.1 Previous Pumping Tests

Preliminary variable/constant rate pumping tests were performed on Well 1, Well 2, Well 4, and Well 5 by NYSDEC registered water well contractors Claverack Well and Pump Service (NYRD10351) and Titan Drilling Corporation (NYRD10178) in the spring and summer of 2024. Hydrographs displaying the water levels measured are available in Appendix B. These previous pumping tests were used to inform the step-test and 72-hour pumping test described in Sections 2.2 and 2.3.

2.1.1 Well 1

A 72-hour variable rate pumping test was completed by Titan at Well 1 from March 6, 2024 at 8:35 AM to March 9, 2024 at 8:35 AM. The initial pumping rate at the start of the test was approximately 27 gpm and the rate was progressively reduced to 4 gpm after approximately 65 minutes of pumping. An increase in water levels was observed after 24 hours of pumping. A review of the pumping data indicated that a minimum of 6 hours of stabilized drawdown did not occur and the water level was directly affected by a local precipitation event.

Static water levels were monitored in the pumping well with a manual water level meter throughout the duration of the pumping test and recovery. Water levels were also measured with Level Troll 700 pressure transducers throughout the pumping and recovery periods in onsite observation wells Well A, Well B, and Well C and offsite private observation wells Delaney, Henne, E. Maassmann, and P. Maassmann. The pumping well and monitoring locations are shown on Figure 3. Additionally, the water level of the surface water pond directly south of the Well 1 location was measured throughout the pumping and recovery periods. Water levels continued to be monitored in these wells for a minimum of 24 hours during the recovery period or until the well reached 90% recovery. Following the constant rate pumping test, the water level recovered to 99% of the pre-test level within the first 3 hours of recovery.

Continuous pumping of Well 1 at 4.0 gpm resulted in minimal drawdown at all offsite monitoring locations. Hydrographs for the pumping wells and offsite residential wells are available in Appendix B.

2.1.2 Well 2

A 72-hour variable rate pumping test was completed by Titan at Well 2 from April 29, 2024 at 8:15 AM to May 2, 2024 at 8:15 AM. The initial pumping rate at the start of the test was 11 gpm and the rate was progressively reduced to 7.5 gpm after approximately 80 minutes of pumping. A 3-hp submersible well pump was set in Well 2 at a depth of 480 feet bgs for temporary use during the pumping test. Well 2 achieved stabilized drawdown for the final 63 hours and 20 minutes of the constant rate test at 7.5 gpm with a maximum fluctuation of 0.20 feet throughout the final 6 hours of the pumping test.

Static water levels were monitored in the pumping well with a manual water level meter throughout the duration of the pumping test and recovery. Water levels were also measured with Level Troll 700 pressure transducers throughout the pumping and recovery periods in onsite observation wells Well 1, Well A, Well B, and Well C and offsite private observation wells Delaney, Henne, E. Maassmann, and P. Maassmann. The pumping well and monitoring locations are shown on Figure 3. Water levels continued to be monitored in these wells for a minimum of 24 hours during the recovery period or until the well reached 90% recovery. Following the constant rate pumping test, the water level recovered to 91% of the pre-test level within the first 2.2 hours of recovery.

Continuous pumping of Well 2 at 7.5 gpm resulted in minimal drawdown at all offsite monitoring locations. Hydrographs for the pumping wells and offsite residential wells are available in Appendix B.

2.1.3 Well 4

A 75-hour variable rate pumping test was completed by Claverack at Well 4 from June 24, 2024 at 9:00 AM to June 27, 2024 at 12:00 PM. The initial pumping rate at the start of the test was 27 gpm and the rate was progressively reduced to 20 gpm after approximately 190 minutes of pumping. A 7.5-hp submersible well pump was set in Well 4 at a depth of 500 feet bgs for temporary use during the pumping test. Well 4 achieved stabilized drawdown for the final 73 hours and 20 minutes of the constant rate test at 20 gpm with a maximum fluctuation of 0.20 feet throughout the final 6 hours of the pumping test.

Static water levels were monitored in the pumping well with a manual water level meter throughout the duration of the pumping test and recovery. Water levels were also measured with Level Troll 700 pressure transducers throughout the pumping and recovery periods in onsite observation wells Well 1, Well 2, Well 5, Well A, Well B, and Well C and offsite private observation wells Yanashusky, Delaney, Henne, E. Maassmann, and P. Maassmann. The pumping well and monitoring locations are shown on Figure 3. Water levels continued to be monitored in these wells for a minimum of 24 hours during the recovery period or until the well reached 90% recovery. Following the constant rate pumping test, the water level recovered to 73.2% of the pre-test level within 74 hours and 10 minutes of recovery.

Continuous pumping of Well 4 at 20 gpm resulted in minimal drawdown at offsite monitoring locations P. Maassmann, Delaney, Henne, Yanashusky, and Henne. Approximately 10 feet of drawdown was observed at E. Maassmann well throughout the pumping period. Hydrographs for the pumping wells and offsite residential wells are available in Appendix B.

2.1.4 Well 5

A 123.5-hour variable rate pumping test was completed by Claverack at Well 5 from August 5, 2024 at 7:00 AM to August 10, 2024 at 11:00 AM. The initial pumping rate at the start of the test was 69 gpm and the rate was progressively reduced to 25 gpm after approximately 51.3 hours of pumping. A 7.5-hp submersible well pump was set in Well 5 at a depth of 445 feet bgs for temporary use during the pumping test. Well 5 achieved stabilized drawdown for the final 72 hours of the constant rate test at 25 gpm with a maximum fluctuation of 0.30 feet throughout the final 6 hours of the pumping test.

Static water levels were monitored in the pumping well with a manual water level meter throughout the duration of the pumping test and recovery. Water levels were also measured with Level Troll 700 pressure transducers throughout the pumping and recovery periods in onsite observation wells Well 1, Well 2, Well 4, Well A, Well B, and Well C and offsite private observation wells Yanashusky, Delaney, Henne, E. Maassmann, and P. Maassmann. The pumping well and monitoring locations are shown on Figure 3. Water levels continued to be monitored in these wells for a minimum of 24 hours during the recovery period or until the well reached 90% recovery. Following the constant rate pumping test, the water level recovered to 71% of the pre-test level within 22 hours 50 minutes of recovery.

Continuous pumping of Well 5 at 25 gpm resulted in minimal drawdown at offsite monitoring locations P. Massmann, Petronio, Merlino, Yanashusky, and Henne. Drawdown measured at E. Massmann and DuVernoy resulted in approximately 16 feet and 7.5 feet of drawdown, respectively. Hydrographs for the pumping wells and offsite residential wells are available in Appendix B.

2.2 Step-Drawdown Tests

A step drawdown pumping test was performed by Claverack, with field oversight by STERLING, on Well 1, Well 2, Well 4, and Well 5 from October 21 to October 24, 2024 to estimate the sustainable long-term yield for each well. The step drawdown tests consisted of successive periods of pumping at progressively increasing flow rates with a minimum of 60 minutes per step.

The background static water level was monitored prior to initiating the tests, and drawdown was monitored throughout the duration of the step drawdown test. The recovery water level was monitored following the completion of the test and throughout the recovery period. Water levels were monitored using submersible pressure transducers capable of recording water levels to at least the nearest 0.01 foot. Data produced during the step drawdown test were reviewed to confirm the stabilized yield of each well. The results of the step drawdown tests are summarized in Table 3.

Table 3 – Step Drawdown Pumping Test Data

Well	Date	Duration (minutes)	Rate (gpm)	Drawdown (ft)	Specific Capacity	Static Water Level
Well-1	10/24/2024	60	5.3	131.25	0.040	42.75
Well-1	10/24/2024	180	7	416.25	< 0.017	
Well-2	10/22/2024	90	4.5	110.4	0.041	227.40
Well-2	10/22/2024	68	5.15	160.88	0.032	
Well-4	10/23/2024	60	18.4	19.19	0.959	256.98
Well-4	10/23/2024	60	28	38.96	0.719	
Well-4	10/23/2024	145	40	69.04	0.579	
Well-5	10/21/2024	60	16	8.91	1.796	209.52
Well-5	10/21/2024	60	29	16.78	1.728	
Well-5	10/21/2024	60	41	25.77	1.591	
Well-5	10/21/2024	85	70	48.5	1.443	

Note: Specific capacity is the pumping rate divided by the drawdown.

The results of the step drawdown test indicated that Well 1 and 2 are low yielding with a near-zero specific capacity. Therefore, Well 1 and Well 2 are not conducive for use as a public water supply well. Well 4 and Well 5 were able to exceed the maximum daily demand for the project and have a specific capacity indicating adequate well efficiency for the target flow rate. Both Well 4 and Well 5 were further evaluated through independent constant rate 72-hour pumping tests to determine the safe yield of local aquifer for comparison to the project maximum daily demand.

2.3 Constant Rate Pumping Tests

2.3.1 Well 5

A constant rate 72-hour pumping test was performed on Well 5 at a rate of 32 gpm. The constant rate test was initiated at 9:30 AM on November 4, 2024 and concluded at 9:30 AM on November 7, 2024. A 7.5 hp 3-phase submersible well pump was installed in Well 5 at a depth of 400 feet below top of casing (btoc) for temporary use during the pumping test. A check valve was installed at the base of the pump discharge pipe to eliminate backflow of water into the well at the conclusion of the pumping test to accurately monitor

groundwater recovery. As shown in the monitoring data and hydrograph in Appendix B, stabilized drawdown was achieved for the final 7 hours and 50 minutes at end of the test. The NYSDEC defines stabilized drawdown as “a water level that has not fluctuated by more than plus or minus 0.5 foot for each 100 feet of water in the well over at least a six-hour period of constant pumping flow rate”.

Prior to initiating the pumping test, the static water level in Well 5 was 208.40 feet btoc, which equates to a total pre-test water column height of 236.60 feet. Therefore, the acceptable fluctuation during the final six hours of the pumping test was 1.18 feet or less (i.e., $236.60 \text{ ft of water column} / 100 \text{ ft} \times 0.5 = 1.18 \text{ ft}$). Throughout the final six hours of the pumping test, the water level in Well 5 displayed a maximum fluctuation of 0.69 feet. At the conclusion of the pumping period, the water level in Well 5 recovered to 75% of the pre-test water level after 24 hours of recovery. In accordance with NYSDOH Part 5, a detailed hydrogeologic assessment is required for proposed water supply wells that do not recover to 90% of the pre-test water level after 24 hours of recovery. As described in Sections 2.9 and 2.10 and shown on Figure 7, the detailed assessment documented the presence of a stratified aquifer with the water bearing deeper zone achieving the 90% recovery target within 24 hours.

Static water levels were monitored in the pumping well (Well 5) and three onsite observation wells (Well 1, Well 2, and Well 4) for a minimum period of one week prior to the start of the constant rate pumping test to identify water level trends not attributable to the pumping test. Water levels continued to be monitored in these wells for a minimum of 24 hours during the recovery period. Water levels were also measured in six offsite private observation wells throughout the pumping and recovery periods. Monitoring locations are displayed on Figure 3.

During the constant rate test, water was discharged away from Well 5 to minimize the potential for recharge of the aquifer near the pumping well. Water was discharged 300 feet to the south and cross/downgradient of Well 5, as shown in Figure 2. The results of the constant rate pumping test and time-drawdown hydrographs are displayed in Appendix B.

Continuous pumping of Well 5 at 32 gpm resulted in a maximum drawdown in the well of 77.64 feet resulting in a remaining water column height of 159.05 feet during stabilized conditions at the end of the pumping test. A hypothetical semi-logarithmic plot showing the 180-day projection of the time-drawdown curve is presented in Appendix C. The plot predicts the potential long-term drawdown within Well 5 based on a continuous pumping rate of 32 gpm. The 180-day projection analysis indicates a total projected drawdown of 128.85 feet resulting in a remaining water column height of 107.75 feet after 180 days of continuous pumping (i.e., 24 hours per day, 7 days per week) at the maximum daily demand for the project.

A distance-drawdown graph of maximum drawdown versus distance away from Well 5 is provided in Appendix D. The graph depicts how groundwater drawdown decreases as distance increases away from the pumping well. This is known as the cone of depression and is centered on the pumping well. A distance-drawdown graph is most useful in identifying the radius of influence in an unconsolidated, unconfined aquifer and was completed for using maximum drawdown data from Well 5 and Well 2 at the conclusion of the constant-rate pumping period (i.e., 11/7/2024 at 9:30 am). The local aquifer is fractured bedrock, and the actual distance-drawdown correlation is affected by the fractured nature of the bedrock aquifer, typically resulting in an irregular area of influence.

2.3.2 Well 4

A constant rate 73-hour pumping test was performed on Well 4 at a rate of 32 gpm. The constant rate test was initiated at 11:00 AM on December 2, 2024 and concluded at 12:00 PM on December 5, 2024. A 7.5 hp 3-phase submersible well pump was installed in Well 4 at a depth of 500 feet btoc for temporary use during the pumping test. A check valve was installed at the base of the pump discharge pipe to eliminate

backflow of water into the well at the conclusion of the pumping test to accurately monitor groundwater recovery. As shown in the monitoring data and hydrograph in Appendix B, stabilized drawdown was achieved for the final 18 hours and 10 minutes at end of the test.

Prior to initiating the pumping test, the static water level in Well 4 was 256.83 feet btoc, which equates to a total pre-test water column height of 353.17 feet. Therefore, the acceptable fluctuation during the final six hours of the pumping test was 1.77 feet or less (i.e., $353.17 \text{ ft of water column} / 100 \text{ ft} \times 0.5 = 1.77 \text{ ft}$). Throughout the final six hours of the pumping test, the water level in Well 4 displayed a maximum fluctuation of 0.60 feet. At the conclusion of the pumping period, the water level in Well 4 recovered to 83.6% of the pre-test water level after 24 hours of recovery. In accordance with NYSDOH Part 5, a detailed hydrogeologic assessment is required for proposed water supply wells that do not recover to 90% of the pre-test water level after 24 hours of recovery. As described in Sections 2.9 and 2.10 and shown on Figure 7, the detailed assessment documented the presence of a stratified aquifer with the water bearing deeper zone achieving the 90% recovery target within 24 hours.

Static water levels were monitored in the pumping well (Well 4) and three onsite observation wells (Well 1, Well 2, and Well 5) for a minimum period of one week prior to the start of the constant rate pumping test to identify water level trends not attributable to the pumping test. Water levels continued to be monitored in these wells for a minimum of 24 hours during the recovery period. Water levels were also measured in six offsite private observation wells throughout the pumping and recovery periods. Monitoring locations are displayed on Figure 3.

During the constant rate test, water was discharged away from Well 4 to minimize the potential for recharge of the aquifer near the pumping well. Water was discharged 300 feet to the south and cross/downgradient of Well 4, as shown in Figure 2. The results of the constant rate pumping test and time-drawdown hydrographs are displayed in Appendix B.

Continuous pumping of Well 4 at 32 gpm resulted in a maximum drawdown in the well of 103.92 feet resulting in a remaining water column height of 249.25 feet during stabilized conditions at the end of the pumping test. A hypothetical semi-logarithmic plot showing the 180-day projection of the time-drawdown curve is presented in Appendix C. The plot predicts the potential long-term drawdown within Well 4 based on a continuous pumping rate of 32 gpm. The 180-day projection analysis indicates a total projected drawdown of 132.42 feet resulting in a remaining water column height of 220.75 feet after 180 days of continuous pumping (i.e., 24 hours per day, 7 days per week) at the maximum daily demand for the project.

A distance-drawdown graph of maximum drawdown versus distance away from Well 4 is provided in Appendix D. The graph depicts how groundwater drawdown decreases as distance increases away from the pumping well. This is known as the cone of depression and is centered on the pumping well. A distance-drawdown graph is most useful in identifying the radius of influence in an unconsolidated, unconfined aquifer and was completed for using maximum drawdown data from Well 4 and Well 2 at the conclusion of the constant-rate pumping period (i.e., 12/5/2024 at 12:00 pm). The local aquifer is fractured bedrock, and the actual distance-drawdown correlation is affected by the fractured nature of the bedrock aquifer, typically resulting in an irregular area of influence.

2.4 Offsite Well Monitoring

Neighboring offsite monitoring well information was collected prior to initiating the hydrogeologic investigation via onsite inspection, discussions with the neighbor and/or via well survey solicitation. Table 4 displays a summary of neighboring wells that were monitored during the hydrogeologic investigation. Figure 3 displays the locations of offsite private monitoring wells. Signed consent and release forms for

volunteer well monitoring were received prior to accessing the properties for installation of water level monitoring equipment.

Table 4 – Offsite Private Monitoring Well Details

Monitoring Well	Address	Total Well Depth (ft)	Distance to Well 5 (ft)	Distance to Well 4 (ft)
David Palka (Tax Map #117.00-1-28.12)	22 Bald Hills Road N	Not Known. Pump Intake at 93.0 feet btoc	1,556	1,686
Mark Henne (Tax Map #116.00-1-34)	169 Bald Hills Road N	97	1,290	1,494
Rosemarie Green (Tax Map #116.00-1-22)	103 Bald Hills Road N	Not Known.	1,227	1,494
Edward Maassmann (Tax Map #116.00-1-21)	85 Bald Hills Road N	340	1,205	1,425
Peter Maassmann (Tax Map #116.00-1-16.12)	139 Bald Hills Road N	230	1,130	1,366
Robert Yanashusky (Tax Map #116.00-1-26)	56 Crows Nest Road	230	801	961
Stephen Petronio (Tax Map#134.00-2-3.1)	276 Crows Nest Road	383	2,465	**2,236
Michael DuVernoy (Tax Map#116.00-1-41)	154 Bald Hills Road N	160-170	1,403	**1,509
Joseph Merlino (Tax Map#116.00-1-33)	179 Bald Hills Road N	150-158	1,560	**1,612
Donald Delaney (Tax Map#116.00-1-23)	121 Bald Hills Road N	153	1,183	**1,416

**Offsite Well monitored during preliminary well pumping test of Well 5 only and not during November-December 2024 well pumping tests of Well 4 and Well 5.

Note: Distances are measured as the straight-line distance from the offsite property well to Well 5 and Well 4.

2.4.1 David Palka Well (22 Bald Hills Road N)

Water levels in the private water supply well for the Palka residence were measured with a submersible pressure transducer from October 29 through November 11, 2024 and from November 25 through December 12, 2024. The static water level prior to conducting the pumping test at Well 5 was 66.98 feet btoc. A total drawdown of 2.97 feet was observed throughout 72 hours of pumping Well 5 at 32 gpm. No discernable drawdown was observed at the well throughout 73-hour constant rate pumping test performed at Well 4. A review of the water level data indicates that continuous pumping of Well 5 and Well 4 at the maximum daily demand will have minimal to no effect on the ability of the Palka well to produce water for residential use. The total depth of the Palka well is not known.

Hypothetical semi-logarithmic plots showing the 180-day projection of the time-drawdown curves are presented in Appendix C. The plots show the potential long-term drawdown within the well based on normal residential use and continuous pumping of either Well 5 or Well 4 at 32 gpm. The 180-day projection analysis for the Well 5 pumping test indicates a total projected drawdown of 3.19 feet, which

provides 22.75 feet of water column remaining above the well pump intake after 180 days of continuous pumping with no recharge to the aquifer. The 180-day projection plotted for the data collected from the Palka well during the constant rate pumping test performed at Well 4 indicated that no additional drawdown would be produced from long term continuous pumping of Well 4 at 32 gpm. Therefore, no adverse impact is anticipated on the ability of the Palka well to produce water for residential use.

2.4.2 Mark Henne Well (169 Bald Hills Road N)

Water levels in the private water supply well for the Henne residence were measured with a submersible pressure transducer from October 29 through November 11, 2024 and from November 25 through December 12, 2024. No observable drawdown was observed throughout either of the constant rate pumping tests performed on Well 5 and Well 4 at 32 gpm. A review of the water level data indicates that continuous pumping of either Well 5 or Well 4 at the maximum daily demand will have minimal effect on the Henne well.

Hypothetical semi-logarithmic plots showing the 180-day projection of the time-drawdown curves are presented in Appendix C. The plots show the potential long-term drawdown within the well based on normal residential use and individual continuous pumping of Well 5 or Well 4 at 32 gpm. The 180-day projection analysis for pumping of Well 5 indicates a total projected drawdown of 0.23 feet, which provides 63.40 feet of water column remaining above the bottom of the well after 180 days of continuous pumping with no recharge to the aquifer. The 180-day projection plotted for the data collected from the Henne well during the constant rate pumping test performed at Well 4 indicated that no additional drawdown would be produced from continuous long-term pumping of Well 4 at 32 gpm. Therefore, no adverse impact is anticipated from the project on the Henne well.

2.4.3 Peter Maassmann Well (139 Bald Hills Road N)

Water levels in the private water supply well for the P. Maassmann residence were measured with a submersible pressure transducer from October 29 through November 11, 2024 and from November 25 through December 12, 2024. No observable drawdown was observed throughout either of the constant rate pumping tests performed on Well 5 and Well 4 at 32 gpm. A review of the water level data indicates that the continuous pumping of either Well 5 or Well 4 at the maximum daily demand will have minimal effect on the P. Maassmann well.

Hypothetical semi-logarithmic plots showing the 180-day projection of the time-drawdown curves are presented in Appendix C. The plots show the potential long-term drawdown within the well based on normal residential use and individual continuous pumping of Well 5 or Well 4 at 32 gpm. The 180-day projection analysis performed for the Well 5 pumping test indicates a total projected drawdown of 0.49 feet, which provides 220.25 feet of water column remaining above the bottom of the well after 180 days of continuous pumping with no recharge to the aquifer. The 180-day projection plotted for the data collected from the P. Maassmann well during the constant rate pumping test performed at Well 4 indicated that no additional drawdown would be produced from continuous long-term pumping of Well 4 at 32 gpm. Therefore, no adverse impact is anticipated from the project on the P. Maassmann well.

2.4.4 Robert Yanashusky Well (56 Crows Nest Road)

Water levels in the private water supply well for the Yanashusky residence were measured with a submersible pressure transducer from October 29 through November 11, 2024 and from December 2 through December 12, 2024. Monitoring for the Well 5 pumping test began on December 2, 2024 due to site access and equipment availability. No observable drawdown was observed throughout either of the constant rate pumping tests performed on Well 5 and Well 4 at 32 gpm. A review of the water level data

indicates that the continuous pumping of either Well 5 or Well 4 at the maximum daily demand will have minimal effect on the Yanashusky well.

Hypothetical semi-logarithmic plots showing the 180-day projection of the time-drawdown curves are presented in Appendix C. The plots show the potential long-term drawdown within the well based on normal residential use and individual continuous pumping of Well 5 or Well 4 at 32 gpm. The 180-day projection analysis indicates a total projected drawdown of 0.00 feet from both pumping wells, which provides 161.83 feet of water column remaining above the bottom of the well after 180 days of continuous pumping of Well 5 or Well 4 with no recharge to the aquifer. Therefore, no adverse impact is anticipated from the project on the Yanashusky well.

2.4.5 Edward Maassmann Well (85 Bald Hills Road N)

Water levels in the private water supply well for the E. Maassmann residence were measured with a submersible pressure transducer from October 29 through November 11, 2024 and from November 25 through December 30, 2024. The static water level was 178.25 feet btoc (726.75 feet amsl) prior to conducting the pumping test at Well 5 and 186.51 feet btoc (718.49 feet amsl) prior to conducting the pumping test at Well 4. A total drawdown of 16.74 feet and 15.84 was observed throughout 72 hours of pumping Well 5 and Well 4 at 32 gpm, respectively, indicating reproduceable conditions were achieved for both pumping tests. A review of the water level data indicates that continuous pumping of Well 5 or Well 4 at the maximum daily demand directly influences the E. Maassmann well. As displayed in the hydrograph in Appendix B, the water level progressively decreased throughout the pumping periods and then recovered to 62% (716.32 feet amsl) and 60% (712.16 feet amsl) of the static water level after 4 days of recovery following completion of the pumping period for Well 5 and Well 4, respectively.

Hypothetical semi-logarithmic plots showing the 180-day projection of the time-drawdown curves are presented in Appendix C. The plots show the potential long-term drawdown within the well based on normal residential use and continuous pumping of Well 5 or Well 4 at 32 gpm. The 180-day projection analysis for the E. Maassmann well with Well 5 pumping indicates a total projected drawdown of 40.46 feet to 668.5 feet amsl, which provides 103.50 feet of water column remaining in the well after 180 days of continuous pumping with no recharge to the aquifer. The 180-day projection analysis for the E. Maassmann well with Well 4 pumping indicates a total projected drawdown of 34.14 feet to 668.50 feet amsl, which provides 103.50 feet of water column remaining in the well after 180 days of continuous pumping with no recharge to the aquifer. The 180-day drawdown analyses both concluding at 668.50 indicates that slow recovery in the well is indicative of a lower transmissivity in the shallow fracture zone and is not being permanently lowered by pumping of the proposed production wells at 32 gpm. The analysis demonstrates that adequate groundwater capacity is available to support the maximum daily demand for the project while maintaining sufficient water column in the E. Maassmann well. Therefore, no adverse impact is anticipated from the project on the E. Maassmann well.

The monitoring event did identify that the pump in the E. Maassmann well is set at a depth of approximately 215 feet btoc, which leaves 125 feet of available water column below the well pump. The well is recommended to be modified by well driller to set the pump at a lower depth to make the entire water column available to the homeowner.

2.4.6 Rosemarie Green Well (103 Bald Hills Road N)

Water levels in the private water supply well for the R. Green residence were measured periodically with a sonic water level meter from November 4 through November 11, 2024 and December 2 through December 30, 2024. Pressure transducers were not used for water level monitoring due an obstruction at 20 feet btoc in the well, limiting the deployment of measurement devices into the well. Periodic monitoring was

considered sufficient given the location of the residence immediately adjacent to the E. Maassmann residence that was continuously monitored by pressure transducer. The static water level was 185.4 feet btoc (722.6 feet amsl) prior to conducting the pumping test at Well 5 and 195.4 feet btoc (709.6 feet amsl) prior to conducting the pumping test at Well 4. A total drawdown of 21.10 feet (701.5 feet amsl) and 21.8 feet (687.8 feet amsl) was observed throughout 72 hours of pumping Well 5 and Well 4 at 32 gpm, respectively, indicating reproduceable conditions were achieved for both pumping tests. As displayed in the hydrograph in Appendix B, the water level drawdown and recovery followed a similar pattern as the adjacent E. Maassmann well.

Hypothetical semi-logarithmic plots showing the 180-day projection of the time-drawdown curve are presented in Appendix C. The plots show the potential long-term drawdown within the well based on normal residential use and continuous pumping of Well 5 or Well 4 at 32 gpm. The 180-day projection analysis indicates a total projected drawdown in Well 5 and Well 4 of 58.85 feet (663.75 feet amsl) and 29.25 feet (661.75 feet amsl), respectively after 180 days of continuous pumping with no recharge to the aquifer, which is similar to the hypothetical projected drawdown for the nearby E. Maassmann well. The well owner at the R. Green residence has been unable to verify the total depth of their well or the pump depth; however, no reports of lost water availability were received during the pumping test. Based on the similar hydrologic conditions and responses of the R. Green well with the adjacent E. Maassmann well, the R. Green well construction is likely to be similar to the E. Maassmann well.

2.5 Surface Water Monitoring

Surface water elevations were measured in the onsite pond (SW-1) adjacent to Well 1 (see Figure 2) throughout the background monitoring period, constant-rate tests at Well 5 and Well 4, and the recovery period with submersible pressure transducer. A hydrograph displaying the surface water levels measured at SW-1 during the pumping tests is available in Appendix B.

During the Well 5 pumping test, a slightly decreasing trend in surface water level was observed throughout the monitoring period, which is attributed to the lack of precipitation and drought conditions and not due to continuous pumping of Well 5 at 32 gpm. The decrease in surface water level occurred during the background monitoring period, and no noticeable change in the drawdown rate was observed during the active pumping period. A review of the surface water data indicates that pumping of Well 5 at 32 gpm does not exhibit direct connection between the surface waters and the bedrock aquifer that the well is completed in. Surface water monitoring data and graphs are presented in Appendix B.

During the Well 4 pumping test, a slightly increasing trend in surface water level was observed throughout the monitoring period, which is attributed to the precipitation events prior to the continuous pumping of Well 4 at 32 gpm. The increase in surface water level occurred during the background monitoring period, and no noticeable change in the drawdown rate was observed during the active pumping period. A review of the surface water data indicates that pumping of Well 4 at 32 gpm does not exhibit direct connection between the surface waters and the bedrock aquifer that the well is completed in. Surface water monitoring data and graphs are presented in Appendix B.

2.6 Precipitation and Barometric Pressure Monitoring

Precipitation data from October 28 through December 30, 2024 was collected from the Cairo Weather Station located in Cairo NY and approximately 3.8 miles northwest of the pumping wells. An onsite manual precipitation gauge was used to support the weather station readings for any site-specific variations. A total of 0.00 inches and 0.02 inches of precipitation was recorded throughout the constant rate pumping test at Well 5 (11/4/2024 – 11/7/2024) and Well 4 (12/2/2024 – 12/5/2024), respectively. Total precipitation

recorded for 7 days prior to the Well 5 and Well 4 constant rate pumping tests was 0.06 inches and 1.72 inches, respectively.

In addition to precipitation observations, onsite barometric pressure was recorded in 15-minute intervals from October 28 through December 30, 2024 with a barometric pressure transducer and in 5 minute intervals from the Round Top weather station. Barometric pressure remained relatively stable throughout the monitoring periods. No evidence of influence to water levels due to barometric pressure changes or precipitation events was apparent in the groundwater level data. Accumulated precipitation and barometric pressure data are displayed in Appendix E.

The site had experienced unseasonally low precipitation prior to and during the constant rate pumping test at Well 5. The most proximal precipitation event, accumulating greater than 0.10 inches, occurred on October 15, 2024 and approximately 13 days prior to the start of the constant rate pumping test at Well 5. A total of 1.68 inches of total precipitation accumulated throughout the month of October at the site. Data available at www.weatherworld.com indicates that onsite accumulated precipitation occurring in October 2024 was 3.2 inches below the 10-year average precipitation total of 5.0 inches for the month of October.

On November 2, 2024, the NYSDEC issued a drought watch for Greene County and 14 other counties due to unseasonally low precipitation. A "watch" is the first of four levels of state drought advisories ("watch," "warning," "emergency", and "disaster"). There are no statewide mandatory water use restrictions in place under a drought watch, but residents are strongly encouraged to voluntarily conserve water. Local public water suppliers may require conservation measures, depending upon local needs and conditions. The constant rate pumping test was performed at what should be considered a worst-case or near worst-case condition for precipitation and recharge of the aquifer. More water is expected to be available to both the onsite water supply wells for the project and the offsite neighboring wells under normal precipitation conditions.

2.7 Aquifer Parameters

Drawdown data recorded during the constant rate pumping test was analyzed using the Theis Solution to determine the transmissivity and storage at the production well. Aquifer parameters were determined using the curve matching techniques within the commercially available AQTESOLV software. The method allows for the development of type curves specific to hydrogeologic conditions and solves an automatic curve fit to water level data changes. Appendix F provides the AQTESOLV time-displacement graph for observation Well 4 during the constant rate pumping test at Well 5.

The analysis for Well 5 uses drawdown and recovery data from observation Well 4. Conversely, the analysis for Well 4 uses drawdown and recovery data from observation Well 5. The analysis estimates transmissivity for Well 5 as 2.251×10^{-2} ft²/min and storativity (S) as 4.266×10^{-5} . Transmissivity and storativity was estimated for Well 4 at 3.126×10^{-2} ft²/min and 8.905×10^{-6} , respectively. Hydraulic conductivity values of 6.341×10^{-5} ft/min and 8.806×10^{-5} ft/min can be determined from the transmissivity estimation for Well 5 and Well 4, respectively. Aquifer parameters are summarized in Table 5 below. Aquifer parameters are consistent with field observations and pumping test results.

Table 5. Calculated Aquifer Parameters

Well	Transmissivity (T)	Storativity (S)	Hydraulic Conductivity (K)
Well 5	2.251×10^{-2} ft ² /min	4.266×10^{-5}	6.341×10^{-5} ft/min
Well 4	3.126×10^{-2} ft ² /min	8.905×10^{-6}	8.806×10^{-5} ft/min

2.8 Hydrogeologic Analysis

The hydrogeologic testing of Well 5 was performed in November 2024 during a state-issued drought watch for Greene and surrounding counties of New York State. The testing period is a worst-case or near worst-case scenario given the historically low precipitation for approximately three months prior to initiating the pumping test at Well 5. The hydrogeologic testing of Well 4 was completed in December 2024 following termination of the state-issued drought watch and when weather conditions were more seasonally stable.

In accordance with NYSDOH Part 5, a detailed hydrogeologic assessment was performed since the both Well 4 and Well 5 did not recover to 90% of the pre-test water level after 24 hours of recovery. A 180-day drawdown projection analysis was performed and the aquifer transmissivity was calculated to confirm the long-term availability of water from the wells and to perform an assessment of potential impacts at neighboring offsite private water supply wells. No adverse impacts to offsite private water supply wells were identified.

Well 5

Well 5 was pumped for 72 hours at a constant rate of 32 gpm, which is the maximum daily demand for the project at full buildout and full capacity. Well 5 reached stabilization for the final 7 hours and 50 minutes, indicating that the well has a safe yield at the rate at which it was pumped during the constant rate test and may actually be capable of supporting a safe yield in excess of 32 gpm. The water level continued to decline slightly throughout the constant rate test and recovered to 75% of the pre-test water level after 24 hours of recovery.

An analysis of the drawdown and recovery data using the Theis equation in AQTESOLV software resulted in aquifer parameters consistent with a fractured shale/sandstone bedrock aquifer (see Appendix F). The 180-day projection analysis indicates a total projected drawdown of 114.05 feet resulting in a remaining water column height of 107.75 feet after 180 days of continuous pumping at the maximum daily demand for the project. The 180-day drawdown analysis is a worst case analysis assuming no recharge and continuous pumping for a 180-day period. As described in Section 1.0, the actual long-term water demand for the project is expected to be substantially lower than the 32 gpm pumping rate assessed in this report for purposes of permitting the wells for the maximum daily demand.

Well 4

Well 4 was pumped for 73 hours at a constant rate of 32 gpm, which is the maximum daily demand for the project at full buildout and full capacity. Well 4 reached stabilization for the final 18 hours and 10 minutes, indicating that the well has a safe yield at the rate at which it was pumped during the constant rate test and may actually be capable of supporting a safe yield in excess of 32 gpm. The water level continued to decline slightly throughout the constant rate test and recovered to 83.6% of the pre-test water level after 24 hours of recovery.

An analysis of the drawdown and recovery data using the Theis equation in AQTESOLV software resulted in aquifer parameters consistent with a fractured shale/sandstone bedrock aquifer (see Appendix F). The 180-day projection analysis indicates a total projected drawdown of 134.42 feet resulting in a remaining water column height of 220.75 feet after 180 days of continuous pumping at the maximum daily demand for the project. The 180-day drawdown analysis is a worst case analysis assuming no recharge and continuous pumping for a 180-day period. As described in Section 1.0, the actual long-term water demand for the project is expected to be substantially lower than the 32 gpm pumping rate assessed in this report for purposes of permitting the wells for the maximum daily demand.

The results of the pumping tests and analyses indicate that both Well 5 and Well 4 can individually support a safe yield of at least 32 gpm operating continuously (i.e., 24 hour per day). An influence on offsite private water supply wells was observed for two out of six monitored wells. The affected wells appear to intercept the same bedrock joint orientation in the northwest-southeast direction as do Well 5 and Well 4. While an influence was observed, the pumping test occurred during drought conditions and normal use of the private wells. Observed drawdown and the projected 180-day drawdown analysis (Appendix C) indicates adequate water column is maintained in the private wells for continued uninterrupted use. The 180-day drawdown analysis is a worst case analysis assuming no recharge and continuous pumping for a 180-day period. As described in Section 1.0, the actual long-term water demand for the project is expected to be substantially lower than the 32 gpm pumping rate assessed in this report for purposes of permitting the wells for the maximum daily demand.

2.9 Aquifer Characteristics

A review of well completion reports and the water level data measured during the November-December 2024 constant rate pumping tests at Well 5 and Well 4 indicate that the fractured bedrock aquifer consists of both an upper and a lower fractured zone which supply water to local wells. The hydraulic head (i.e., piezometric surface) in the upper fracture zone is higher than that in the deeper fracture zone indicating a downward vertical hydraulic gradient. This is consistent with the 2009 Groundwater Resources Study and Protection Plan for the Town of Cairo which attributes large differences in well yields to the degree of bedrock fracturing and the presence of low permeable unconsolidated deposits at the surface.

The piezometric surface associated with the deep fracture zone was measured at elevations from 695.69 to 723.30 at Well 5, Well 4, Well 2, E. Maassmann, and R. Green. A shallower piezometric surface was encountered at all other wells. Figure 5 is a profile showing the relative elevations of all wells, the piezometric surfaces associated with the upper and lower fracture zones, and which wells intercept which fracture zones. The piezometric surface in wells intercepting only the upper fracture zone is the hydraulic head in the upper fracture zone while the piezometric surface in wells intercepting both the upper and deeper fracture zones is a composite reflecting the hydraulic head of both zones.

The impacts from individual continuous pumping of Well 5 and Well 4 were identified in some, but not all wells intercepting the deeper fracture zone. The Well 4 water well completion report (Appendix A) indicates fractures were identified at 560 feet bgs and 565 feet bgs or elevations of 390 feet amsl and 385 feet amsl. The presence of these fractures and the higher water yield of the deeper fracture zone is consistent with observations made in the 2009 Groundwater Resources Study. Anecdotal evidence from the driller suggests that the higher (i.e. greater than 20 gpm) yielding water zone was encountered in the lower 50 to 100 feet of Well 4 and Well 5, indicating the higher yielding zone is associated with the deeper fracture zone.

A shallow piezometric surface was measured from 807.83 to 901.74 in Well 1, D. Palka, M. Henne, P. Maassmann, and R. Yanashusky (Figure 4). Wells that draw groundwater predominantly from this upper fracture zone are typically lower yielding (i.e., less than 7.5 gpm) than wells completed in the deeper fracture zone that intersect higher yielding fractures. This indicates that the upper fracture zone exhibits a lower transmissivity.

As shown on Figure 4, continuous pumping of either Well 5 or Well 4 at 32 gpm induced varying levels of drawdown at observation wells that did not necessarily correlate with or depend on the distance from the pumping well. Figure 4 also shows the static water level in some wells was higher than other wells prior to starting the pumping tests. These different static water levels reflect the composite hydraulic head that each well intercepts.

Well 4, Well 5, Well 2, E. Maassmann, and R. Green intercept the same water-bearing fracture, based on similar responses during the pumping tests, as evident in the hydrographs in Appendix C and on Figure 4. The remaining wells (i.e., Well 1, R. Yanashusky, and P. Maassmann) are either too shallow to intercept the deeper water-bearing fracture or are deep enough but do not intercept the same water bearing fracture as Well 4, Well 5, Well 2, E. Maassmann, and R. Green. Figure 5 shows the depth profile and the static water levels for each well.

2.10 Well Recovery

A review of the pumping test data for Well 5 and Well 4 indicates that groundwater flow into the wells is contributed by both the shallow and deep fracture zones. Varying rates of groundwater recovery were observed in the well recovery data measured following the constant rate pumping tests. Wells intercepting both the shallow and deep zones display a period of recharge controlled by the more permeable lower fracture zone until the water level reaches the level of the hydraulic head in the deeper fracture zone. Thereafter, recharge is slower, reflecting the inflow of water from the upper, lower permeability fracture zone. This phenomenon was identified at both Well 5 and Well 4 during constant rate pumping tests at multiple pumping rates and in the offsite monitoring wells E. Maassmann and R. Green.

As described in Section 2.1, preliminary pumping tests were performed on Well 5 in August 2024 in addition to the 72-hour pumping test performed in November 2024. Preliminary pumping tests were performed on Well 4 in June 2024 in addition to the 72-hour pumping test performed in December 2024. Table 6 summarizes the measured drawdown and recovery values obtained during these discrete pumping tests at different pumping rates.

Table 6. Pumping Test Recovery Data

Well and Date	Total Drawdown (ft)	24-hr Recovery Level (ft)	% Recovery at 24-hrs	Recovery Elevation at 24-hrs (ft amsl)	Pumping Rate (gpm)
Well 5 Aug-24	59.9	41.5	69.28	675.25	25
Well 5 Nov-24	77.64	58.35	75.15	676.4	32
Well 4 Dec-24	103.92	86.88	83.60	676.52	20
Well 4 Jun-24	40.2	25.9	64.43	676.6	32

NYSDEC defined stabilization was achieved during these four pumping tests, but the wells did not achieve 90% recovery within the first 24 hours of recovery during any of the tests when compared to the pre-pumping static water level. The stabilized drawdown and 180-day drawdown plots indicate that Well 4 and Well 5 are capable of safely yielding a rate greater than the target pumping rate of 32 gpm.

Percent recovery is often used to quantify recharge of the aquifer following an extended period of pumping. Using percent recovery as a proxy for determining safe yield of the well has limitations in heterogeneous environments because recovery is controlled partially by the drawdown induced in a well and assumes a constant storativity (S) throughout the aquifer. As previously described, Well 4 and Well 5 are completed through a shallow low-permeability fracture zone and a deeper higher permeability fracture zone.

As shown in Table 6, the groundwater elevations recovered to a nearly identical elevation (i.e., approximately 677 feet) for each pumping test at varying pumping rates. Recovery to a specific elevation regardless of pumping rate indicates that full recovery is occurring to the level of the hydraulic head present in the more permeable deeper fracture zone. The consistent recovery to approximately 677 feet amsl

indicates that the piezometric surface has remained stable throughout the hydrogeologic investigation and is not being permanently lowered by pumping of the wells at 32 gpm. Figure 6 displays the recovery data from the four pumping tests with time normalized to minutes and the start of recovery for each pumping test set at time equals zero. The time-drawdown curve for the pumping tests completed at Well 5 and Well 4 passes approximately through the 677 ft amsl point at 24 hours of well recovery.

A well recovery analysis is presented in Figure 7 for Well 4 and Well 5. The plots display the time drawdown curves with extended drawdown curves for the pumping tests completed in November and December 2024. True well recovery incorporates the difference between the measured water level in a well at a given time after pumping stops and the level to which the water would have dropped if pumping continued until that instant. In theory, the degree of water level recovery at any time after pumping ceases should be identical with the drawdown for the same time during the pumping period. Well recovery data measured at 24 hours of recovery was used to back calculate the drawdown data at 24 hours of pumping.

Well 5 displayed a 24-hour extended recovery of 59.97 feet of following the November 2024 pumping test. Drawdown in Well 5 was 63.08 feet at exactly 24 hours of pumping. A difference of 3.11 feet remained between the extended and actual drawdown data. The difference in head (3.11 feet) was added to the water level measured in the well at 24 hours recovery to calculate an interpreted actual deep zone static water level. The water column above the deep zone static level is supplied by the less permeable upper fracture zone, as displayed in the slow recovery above the 677-foot elevation. Given this information, well recovery was recalculated for Well 5 using $\text{Total Drawdown} / (\text{Total Drawdown} + \text{Additional Head}) * 100 = 95\%$ recovery in 24 hours ($59.97 / (59.97 + 3.11) * 100 = 95\%$).

Similarly, Well 4 displayed 24-hour extended recovery of 89.48 feet following the December 2024 pumping test. Drawdown in Well 4 was 95.28 feet at exactly 24 hours of pumping. A difference in hydraulic head of 5.80 feet remained between the interpreted and actual drawdown data. The difference in head (5.8 feet) was added to the water level measured in the well at 24 hours recovery to calculate an interpreted actual deep zone static water level. The water column above the deep zone static level is supplied by the less permeable upper fracture zone, as displayed in the slow recovery above the 677-foot elevation. Given this information, well recovery was recalculated for Well 4 using $\text{Total Drawdown} / (\text{Total drawdown} + \text{additional head}) * 100 = 94\%$ recovery in 24 hours ($89.48 / (89.48 + 5.80) * 100 = 94\%$).

Based on the above analysis, Well 4 and Well 5 achieve the target 90% recovery within 24 hours when focusing on the deeper fracture zone that is the primary source of groundwater to the wells.

2.10.1 Private Water Well Recovery

Groundwater recovery rate at offsite private water supply wells owned by E. Maassmann and R. Green was less than 90% after 24 hours following completion of the pumping tests on Well 4 and Well 5. The slow recharge observed can be attributed to the lower total drawdown and therefore dominance of recharge from the lower permeability zone versus the higher permeability deeper zone. The E. Maassmann and R. Green wells typically display a static water level approximately 10-25 feet above the piezometric surface elevation observed at Well 5 and Well 4, likely due to their proximity to surface water and possibly contributions from the shallow fracture zone.

Anecdotal evidence from the well owner indicates that the E. Maassmann well yield was estimated at or slightly above 18 gpm, following well development. A shallow bedrock well (i.e. less than 150 feet) was originally installed on the property, prior to installation of the existing E. Maassmann well. The well owner indicated that the water level in the shallow well was near the surface and normal well use lasted approximately two weeks before the well fully dewatered. The owner reported that the water level never

reestablished and the new well was installed approximately 50 feet south of the shallow well. This evidence supports the shallow and deeper fracture zones with lower permeability in the shallow zone.

Figure 8 displays a visual comparison of the well recovery rates for Well 4, Well 5, and E. Maassmann. The data are normalized to elevation and time is set to 0 at the start of recovery for each pumping test. The data for E. Maassmann were adjusted to set T=1440 minutes (24-hour recovery) to the aquifer recovery elevation of 677 feet amsl, as identified during the recovery analysis of the onsite pumping wells. A review of the data indicates that the slopes of the recovery curves for Well 5 and Well 4 display a break in slope from faster to slower recovery at approximately 24 hours of groundwater recovery in the wells.

The slope of the recovery curve for E. Maassmann maintains a more uniform curve throughout the full recovery period. The slope of the E. Maassmann recovery curve is identical to the Well 5 and Well 4 recovery curves after 24 hours of pumping. The similarities in the recovery curves past 24 hours indicate that recovery in E. Maassmann is uniform and slow because drawdown in the well has not surpassed the deep fracture zone piezometric surface elevation of 679.63 to 682.05 feet amsl and is exhibiting an identical recovery rate as the post 24-hour rate identified in Well 5 and Well 4. The similar recovery curves indicates that slow recharge in the well is the result of water being supplied by the lower permeability upper fracture zone and is not being permanently lowered by pumping of the proposed production wells at 32 gpm.

2.11 Surface Water/Groundwater Interactions

Surface water level changes observed at monitoring location SW-1 correlate with water loss and/or gain due to localized precipitation events. The decrease in surface water level occurred during the background monitoring period of the Well 5 pumping test, and no noticeable change in the drawdown rate was observed during the active pumping period. The surface water level for SW-1 displayed a slightly increasing trend throughout the background, pumping and recovery periods due to localized precipitation events. A review of the surface water data indicates that pumping of Well 5 or Well 4 at 32 gpm does not exhibit direct connection between the surface waters and the bedrock aquifer that the well is completed in.

As noted in Section 2.6, the pumping tests occurred during drought conditions with unseasonably low precipitation and consequently low groundwater recharge. The drought conditions adds to the conservativeness of the pumping tests since groundwater recharge will replenish the aquifer. The project includes a Stormwater Pollution Prevention Plan that incorporates green practices to capture stormwater for infiltration into the groundwater system. Twenty-one (21) onsite infiltration tests were performed to support the design of the stormwater management practices. The 2009 New York Rural Water Association Groundwater Resources Study and Protection Plan identified the project area as being capable of recharging 7.5 to 10 inches of precipitation per year into the groundwater system. Applying this recharge rate only to the project parcel boundaries of 102.31 acres equates to a recharge of 20,834,715 to 27,779,620 gallons per year (57,081 to 76,108 gallons per day) compared to a maximum daily demand of 46,212 gallons. The actual contributing recharge area is much larger extending beyond the property lines and into the Catskill Mountains.

3.0 MITIGATION

This hydrogeologic study documents that the safe yield is at least 32 gallons per minute (gpm) and capable of supporting development projects that will extract groundwater at a rate equal to or less than 32 gpm. The study identified the direct influence on two adjacent residential wells and included an extended analysis due to observed groundwater recovery slower than the target benchmark of 90% within 24 hours after pumping at Well 4 and Well 5. Based on this analysis, the following mitigation measures are suggested:

1. The direct influence observed at two offsite private residential water supply wells is not significant and does not indicate that the project would deplete the aquifer serving the private wells. The projected 180-day drawdown in the E. Maassmann well retained over 100 feet of available water column for the residential use. As noted in Section 2.4.5, the E. Maassmann well pump is currently set too high to access the available remaining water column and is recommended to be lowered to have full access to the water column. The exact depth of the R. Green well is not known, but the well exhibited identical characteristics as the E. Maassmann well and is expected to have access to a similar remaining water column that is adequate for residential use. The following mitigation is readily available if deemed necessary to alleviate potential concerns to the residential wells:
 - a. Install Deeper Wells: The E. Maassmann and R. Green wells are installed into the deeper higher permeability fracture zone. Both wells could be extended deeper to set their pumps deeper than the 180-day projected drawdown elevation of Well 4 and Well 5. Both Well 4 and Well 5 have a projected drawdown to approximately elevation 560 after 180 days of continuous pumping at the maximum daily demand. The E. Maassmann well is currently completed to a depth of approximately elevation 565 and could be extended slightly deeper to ensure the well pump is installed at or below elevation 560. The drawdown at the offsite residential wells will not be deeper than the drawdown at the project pumping well.
 - b. Connect to Public Water Supply: Alternatively, the E. Maassmann and R. Green wells are immediately adjacent to the project site and could feasibly be incorporated into the project water supply system. Single-family dwellings have a design water demand of 110 gallons per bedroom per day (i.e., 330 gpd for a three bedroom dwelling and 440 gpd for a four bedroom dwelling). Using a residential demand of 500 gpd per dwelling would require an allocation of 1,000 gpd (0.7 gpm) from the design demand flow for the project.

If connection to the project water supply were implemented, the project density would be reduced in size to accommodate the addition of the two dwellings such that the maximum daily demand of the project system remains at 32 gpm.
2. The observed groundwater recovery less than 90% within 24 hours of pumping for Well 4 and Well 5 is attributed to the stratified bedrock aquifer system and not that the aquifer is being depleted. The 90% recovery target is a benchmark that indicates an aquifer is capable of accommodating a sustained pumping rate without the need for a more detailed analysis. As documented in this report, additional analysis was performed to demonstrate that the aquifer can accommodate the sustained target pumping rate of 32 gpm. Nevertheless, the following mitigation is readily available if deemed necessary to alleviate potential concerns related to observed recovery:
 - a. Phased Construction: The development is planned to be constructed over 8 phases with phases 1 through 3 consisting of site infrastructure. Phases 4 through 6 continue the infrastructure buildout and includes the construction of lodging structures with 43 available bedrooms. Phase 7A includes the construction of an additional 47 bedrooms and the 300-seat restaurant. This report conservatively uses tabulated hydraulic loading rates that may overestimate actual water demand. As an example, the United States Geological Survey

publication “Estimated Use of Water In the United States in 2015” reported an estimated per capita water use in New York State of 71 gallons per day compared to the tabulated 110 gallons per day used in this report. The NYS Design Standards for Intermediate Sized Wastewater Treatment Systems allows for design flow rates to be obtained using actual metered daily water use flow rates.

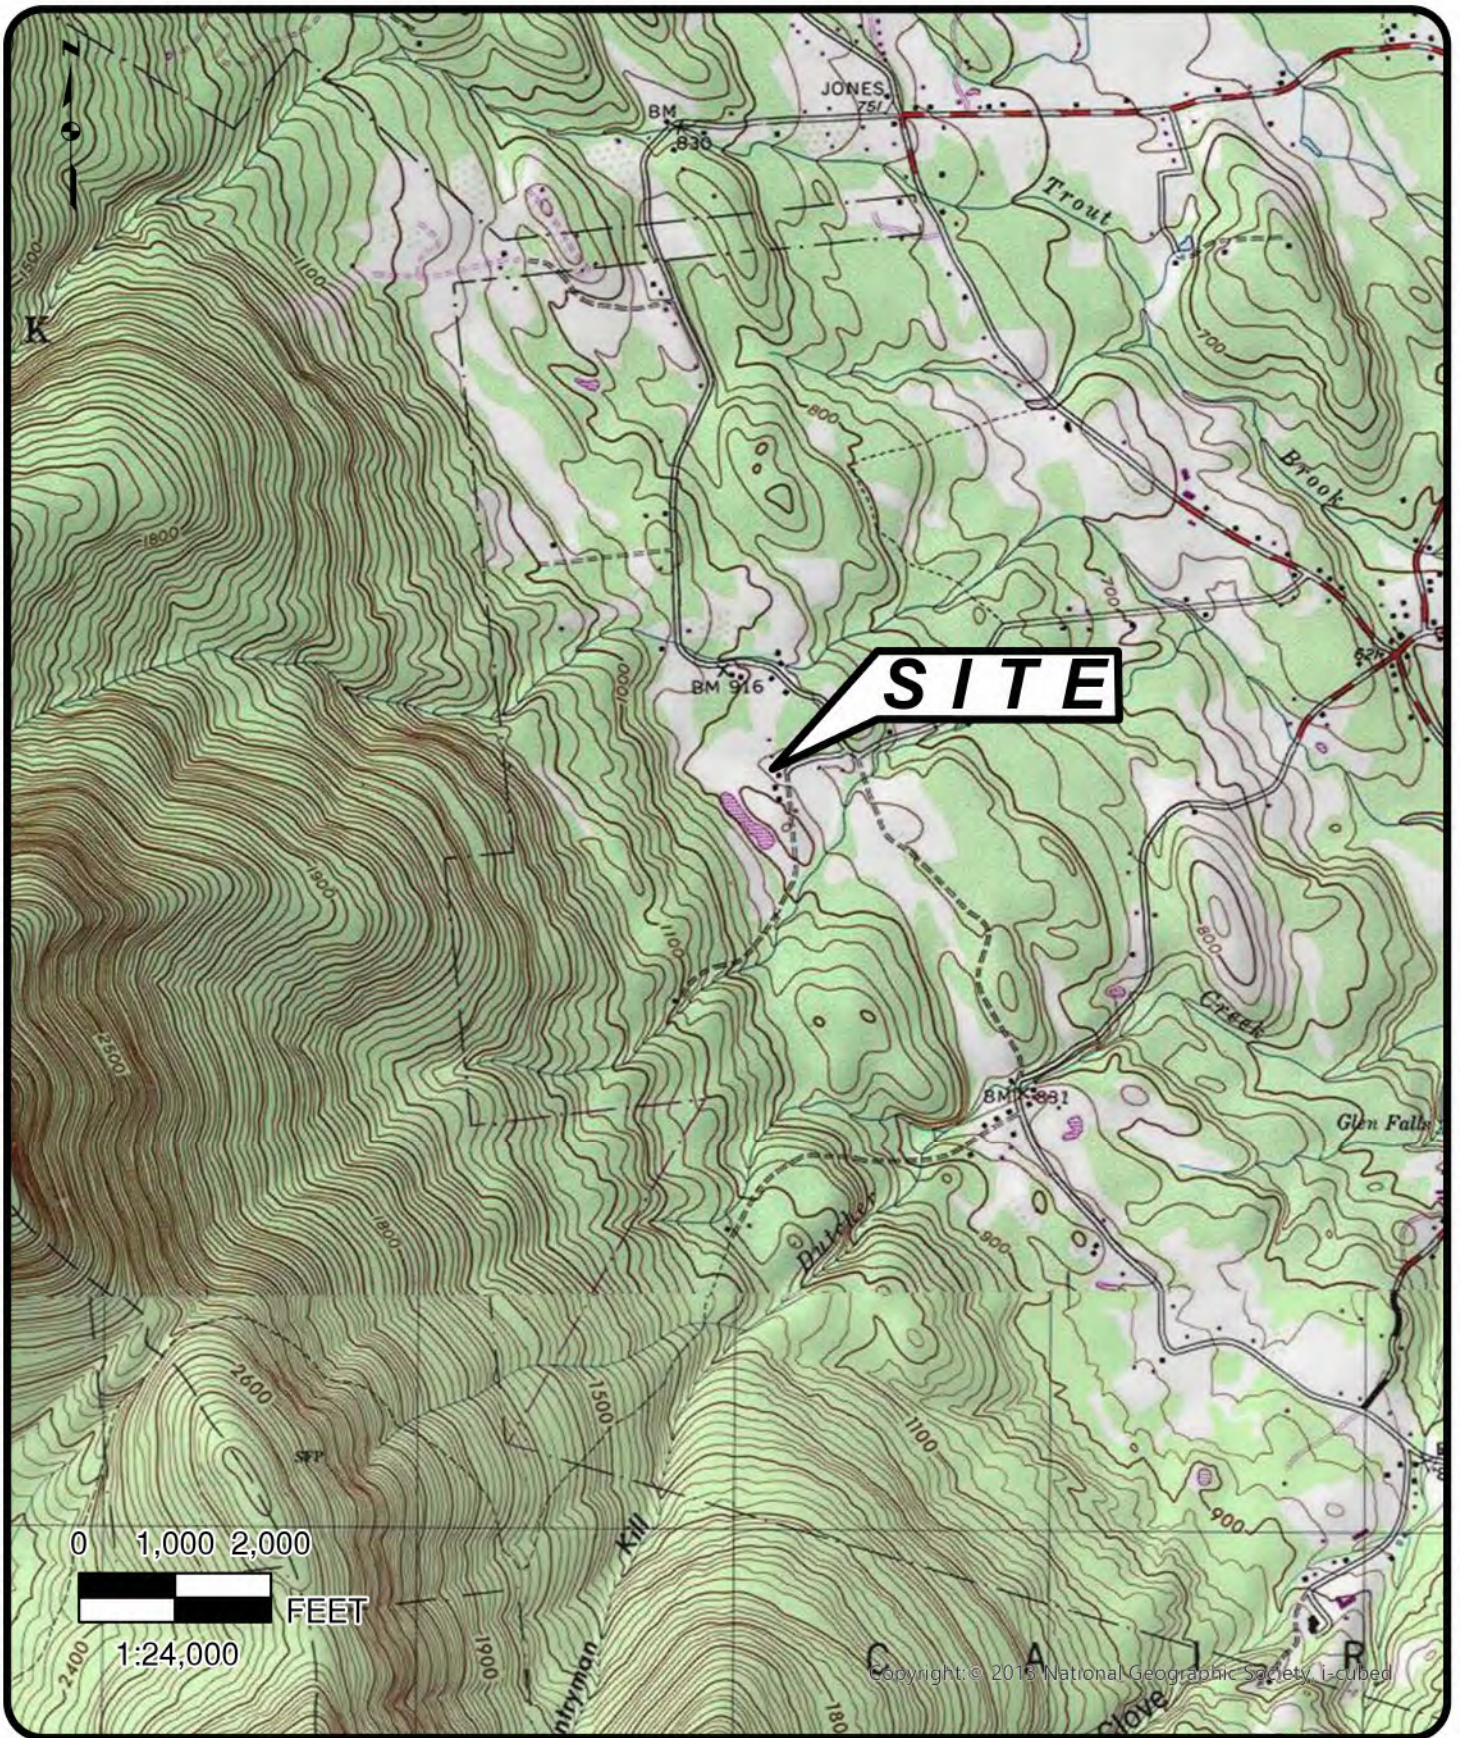

Actual water use can be determined after the completion of Phase 7A (i.e., at approximately 56% of the full buildout water use) to refine the actual maximum daily demand at full buildout and to obtain drawdown and recovery data under operating conditions for a duration longer than 72 hours.

The actual water use and longer-term drawdown and recovery data will be incorporated into a subsequent hydrogeologic report to confirm the findings of this report that the aquifer can accommodate the sustained pumping from the project at full buildout of the remaining Phases 7B, 7C, 8A, 8B, and 8C, which collectively include lodging structures for the remaining 176 bedrooms. Therefore, the project design allows for monitoring actual levels of predicted impacts at an intermediate point of construction that is likely significantly less than water demand assessed in this report.

APPENDIX F

AQTESOLV REPORTS AND GRAPHS

WELL-5 CONSTANT RATE 32 GPM

Data Set:

Date: 11/14/24

Time: 07:58:45

PROJECT INFORMATION

Company: Sterling

Client: Blackhead Mountain Lodge

Project: 2024-59

Location: Round Top, NY

Test Well: Well-5

Test Date: 11/4/2024

WELL DATA

Pumping Wells

Well Name	X (ft)	Y (ft)
Well-5	0	0

Observation Wells

Well Name	X (ft)	Y (ft)
Well-4	235	0

SOLUTION

Aquifer Model: Unconfined

Solution Method: Theis

T = 0.02251 ft²/min

S = 4.266E-5

Kz/Kr = 1.

b = 355. ft

Data Set:
Title: Well-5 Constant Rate 32 gpm
Date: 11/14/24
Time: 07:58:04

PROJECT INFORMATION

Company: Sterling
Client: Blackhead Mountain Lodge
Project: 2024-59
Location: Round Top, NY
Test Date: 11/4/2024
Test Well: Well-5

AQUIFER DATA

Saturated Thickness: 355. ft
Anisotropy Ratio (Kz/Kr): 1.

PUMPING WELL DATA

No. of pumping wells: 1

Pumping Well No. 1: Well-5

X Location: 0. ft
Y Location: 0. ft

Casing Radius: 0.5 ft
Well Radius: 0.5 ft

Fully Penetrating Well

No. of pumping periods: 1058

OBSERVATION WELL DATA

No. of observation wells: 1

Observation Well No. 1: Well-4

X Location: 235. ft

Y Location: 0. ft

Radial distance from Well-5: 235. ft

Fully Penetrating Well

No. of Observations: 1057

SOLUTION

Pumping Test
 Aquifer Model: Unconfined
 Solution Method: Theis

VISUAL ESTIMATION RESULTSEstimated Parameters

Parameter	Estimate	
T	0.03181	ft ² /min
S	1.617E-5	
Kz/Kr	1.	
b	355.	ft

$K = T/b = 8.959E-5$ ft/min (4.551E-5 cm/sec)

$S_s = S/b = 4.555E-8$ 1/ft

AUTOMATIC ESTIMATION RESULTS

Estimated Parameters

Parameter	Estimate	Std. Error	Approx. C.I.	t-Ratio	
T	0.02251	9.753E-5	+/- 0.0001913	230.8	ft ² /min
S	4.266E-5	6.008E-7	+/- 1.179E-6	71.01	
Kz/Kr	1.	not estimated			
b	355.	not estimated			ft

C.I. is approximate 95% confidence interval for parameter

t-ratio = estimate/std. error

No estimation window

$K = T/b = 6.341E-5$ ft/min (3.221E-5 cm/sec)

$S_s = S/b = 1.202E-7$ 1/ft

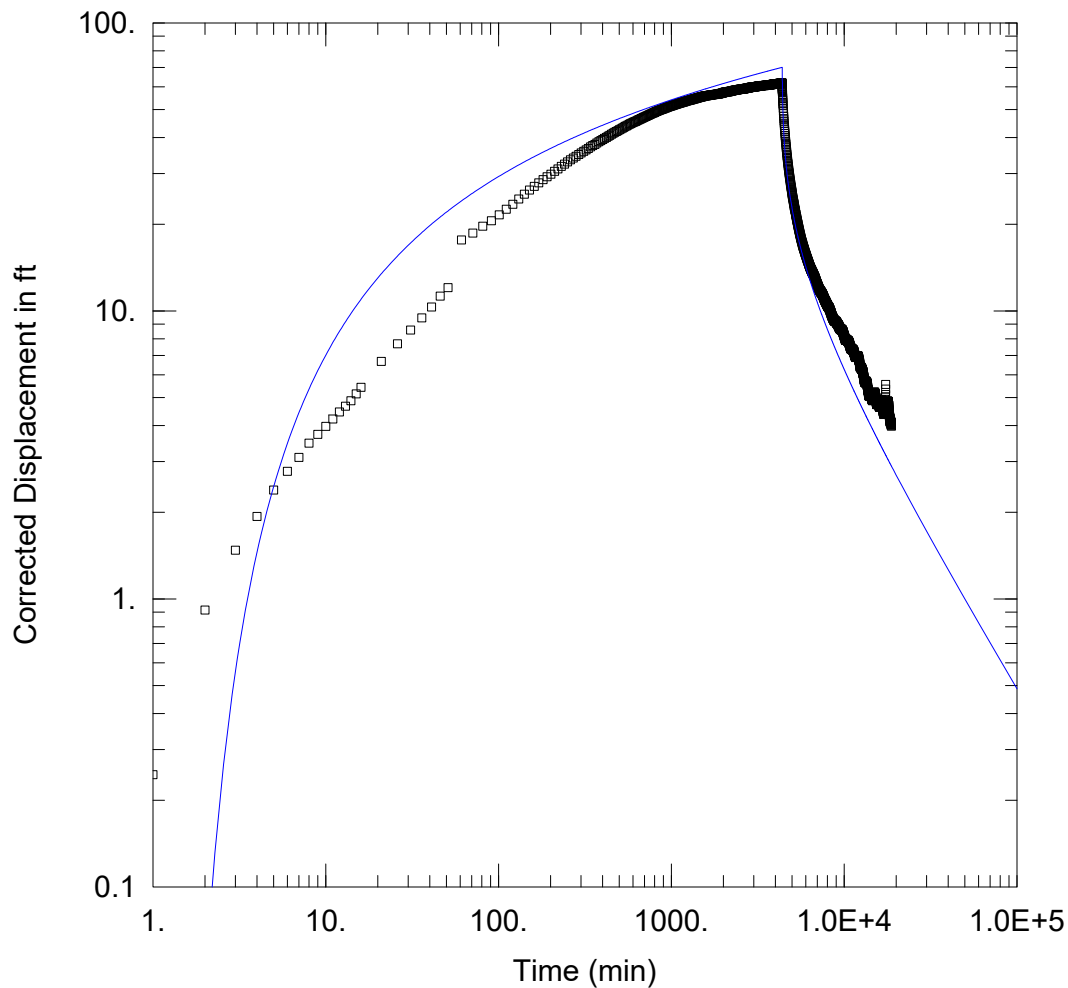

Parameter Correlations

	T	S
T	1.00	-0.88
S	-0.88	1.00

Residual Statistics

for weighted residuals

Sum of Squares 6276. ft²
 Variance 5.949 ft²
 Std. Deviation 2.439 ft
 Mean 0.9867 ft
 No. of Residuals 1057
 No. of Estimates 2

WELL TEST ANALYSIS

Data Set: S:\...\BHML_Well-4.aqt

Date: 01/09/25

Time: 15:38:31

PROJECT INFORMATION

Company: Sterling

Client: Blackhead Mountain Lodge

Project: 2024-59

Location: Round Top, NY

Test Well: Well-4

Test Date: 12/5/2024

WELL DATA

Pumping Wells

Well Name	X (ft)	Y (ft)
Well-4	0	0

Observation Wells

Well Name	X (ft)	Y (ft)
□ Well-5	235	0

SOLUTION

Aquifer Model: Unconfined

Solution Method: Theis

T = 0.03126 ft²/min

S = 8.905E-6

Kz/Kr = 1.

b = 355. ft

OBSERVATION WELL DATA

No. of observation wells: 1

Observation Well No. 1: Well-5

X Location: 235. ft

Y Location: 0. ft

Radial distance from Well-4: 235. ft

Fully Penetrating Well

No. of Observations: 1909

SOLUTION

Pumping Test
 Aquifer Model: Unconfined
 Solution Method: Theis

VISUAL ESTIMATION RESULTSEstimated Parameters

Parameter	Estimate	
T	0.03126	ft ² /min
S	8.905E-6	
Kz/Kr	1.	
b	355.	ft

$$K = T/b = 8.806E-5 \text{ ft/min (4.473E-5 cm/sec)}$$

$S_s = S/b = 2.508E-8 \text{ 1/ft}$
